

Investigating the Structures of Paramagnetic Aggregates from Colloidal Emulsions-2 (InSPACE-2)

PI: Prof. Eric Furst, University of DelawarePS: Dr. Juan Agui, NASA GRCPM: Donna Bohman, NASA GRCEngineering Team: ZIN Technologies

Objective:

 To (1) visually study the gelation transition in magneto-rheological fluids (MR) under steady and pulsed magnetic fields, and (2) continue InSPACE-1 studies to determine the lowest energy configurations of the three dimensional structures of a magneto-rheological fluid in a pulsed magnetic field.

InSPACE in MSG

Glenn Research Center

Knob for Crew Handling

Vial Assembly

Coil Assembly

Relevance/Impact:

 MR fluids are a class of smart materials capable of changing visco-elastic properties. Microgravity data of the internal particle structure and dynamics will provide an assessment of the viscous-elastic properties. These objectives improve limb and dextrous motion in robotic components and human-robotic interfaces for EVA suits.

Development Approach:

- Using the hardware from InSPACE-1 already on ISS, InSPACE-2 will visually study new samples to meet the above objectives. An improved cell design will be used for imaging of the resulting aggregate structures. The new cells are dimensionally very thin in one direction reducing the optical thickness, hence providing enhanced viewing. A new coil is also provided that allows the substitution of multiple samples in two orthogonal orientations for alternate views.
- InSPACE-2 hardware consists of 1 primary Coil Assembly and 1 backup Coil Assembly, 4 vial assemblies and 4 backups.

ISS Resource Requirements

Accommodation (carrier)	Microgravity Science Glovebox				
Upmass (kg) (w/o packing factor)	3.57				
Volume (m³) (w/o packing factor)	0.011				
Power (kw) (peak)	0.030				
Crew Time (hrs) (installation/operations)	14 (~2.5hr./sample)				
Autonomous Ops (hrs)	0				
Launch/Increment	10A Middeck w/L-48hrs. late sample stowage				

Project Life Cycle Schedule
